News

About SoyBase RSS Feed

10/02/09 Soybean data at PLEXdb. [PLEXdb](#) is now home to 13 more soybean data series imported from NCBI-GEO. There are now 16 publicly visible experiments associated with the Soybean Affymetrix chip.

5/22/09 The SoyBase RSS feed is now available. See [here](#) for details.

5/21/09 Try the new SoyBase whole genome [sequence browser](#)

12/08/08 The Glyma1.0 chromosome-based assembly and annotation of soybean is now available, replacing the preliminary contig-based assembly and annotation.

8/15/08 SoyBase Soybean [ontologies](#) are available from the SoyBase site under "Soybean Ontologies" in the SoyBase sub-nav bar. These ontologies cover soybean growth and development. Input from the community is actively encouraged.

[Maps](#)

[BLAST](#)

[Search Tools](#)

[Project Description](#) [Collaborators](#) [Acknowledgements](#)

The Williams 82 Transposable Element Database Home Page

Project Description

The SoyTE database provides resources and information related to transposable elements (TEs) in the soybean genome. The recent availability of the draft sequence of the soybean (*Glycine max*) genome has allowed us to identify numerous TEs in this economically important legume crop. Using a combination of structure-based and homology-based approaches, a total of 32,552 retrotransposons (**Class I**) and 6,029 DNA transposons (**Class II**) with clear boundaries and insertion sites were structurally annotated and clearly categorized. These TE sequences have been anchored in and integrated with the soybean [physical and genetic maps](#), and are [browsable and visualizable](#) at any scale in the sequences of the 20 soybean chromosomes. A [BLAST based tool](#) has been implemented to perform sequence comparisons to the soybean TEs. [Search tools](#) facilitate the annotation of any genomic sequence of soybean or other related legume species. Sequences of TEs or subsets of TEs are freely accessible to interested users and can be downloaded from the database website.

This database has laid the foundation for precise annotation of the non-TE genes in the soybean genome. Future studies will focus on the identification of active TE elements, functional characterization of genes or gene fragments captured by transposons, and study of the co-evolution of TEs and the host genome.

SoyCyc: A Soybean Metabolic Database and Data Exploration Tool

- Computationally predicted enzymatic functions for Wm82 Gm1.01 gene calls based on sequence similarity to known plant genes
 - Searchable by pathway, function, compound etc.
- Comparative
 - Allows the comparison of pathways shared between available taxa (*G. max*, *M. truncatula*, *A. thaliana*)
- Descriptive
 - Able to assign transcriptomic values to pathways to see what pathways have components up/down regulated

Identified Soybean Metabolic Pathways

Glycine max Pathway: brassinosteroid biosynthesis II
