SoyBase News

Uniform Trial Data now available December 17 2015

An experimental database summarizing the results of the 2012 and 2013 Soybean Uniform Tests: Northern Region is available at SoyBase. We are making these data available to the community to solicit suggestions for improvements to the data display and functionality of the database. These tables are the summary data taken from the Uniform Tests for those years. For a full report, including methodology and comments, see the Northern Test report publications. The database could be expanded to include earlier years if there is an interest from the community, so please let us know by leaving us comments through the "Contact Us" links.

Uniform Trial Entries Parentage Database December 17 2015

A soybean parentage database is available at SoyBase. It provides parentage information gleaned from the Soybean Uniform Tests for the Northern and Southern states and other published sources. The database lists the parentage of entries in the Uniform Tests as they were supplied by the cooperators and where possible the parentage of each strain was traced back to PI accessions or named strains. Searches are performed by strain names and can be filtered by region. If you have suggestions on extending or making the interface better or have corrections to the parentage information please let us know by clicking on the "Contact Us" links and describing your suggestions or providing corrections to the parentage information.

SoyNAM Project Page

Nested Association Mapping (NAM) of Genes Controlling Soybean Yield and Other Key Traits

Our goal is to improve the yield potential of soybean varieties. To this end we have mapped the chromosomal locations of genes that control yield and other important agronomic traits in both domestic and exotic germplasm using a Nested Association Panel composed of 40 important soybean varieties and cultivars crossed to a common hub parent. Further details about the [SoyNAM Project](#) are available. Funding was provided by the North Central Soybean research Program (NCSRP) and the United Soybean Board (USB).

NAM Parents

140 Recombinant Inbred Lines (RILs) were developed from each cross between the NAM parents and IA3023.

Click on a NAM Parent for details about that Population.

Variety Name: CM422

CM422 is a maturity group V high-yielding cultivar with resistance to Asian soybean rust (ASR). Resistance to ASR was derived from PI 459025 via L87-0482 (PI 547879). This is the first southern US cultivar release with Rpp4 resistance to ASR. CM422 originated as a single F6 plant derived from the cross 5601T x L87-0482. 5601T was derived from the cross Hutcheson x TN89-39. L97-0482 was derived from Williams 82 x PI 459025. The cross of 5601T x L87-0482 was made at Stoneville, MS in 2004. CM422 was tested for three years (2009-2011) in Paraguay across 13 environments and across 12 environments in 2010 and 2011.

[View Uniform Field Trial Data Here](#)

Uniform Soybean Tests Parentage Information

The soybean parentage information in this database was partially gleaned from the Uniform Soybean Tests for the **Southern** and **Northern** regions as well as other sources such as USDA technical bulletins, variety registrations and PVP applications. The strains that appear here were part of the uniform trials and not the preliminary trials. In most cases, the pedigree of individual strains was followed back to named strains in both maternal and paternal lineages where possible. In some cases, the parentage of strains was not specified by the cooperators in the tests. In those cases the maternal and paternal parents are labeled as "Unspecified". In some cases, the actual parental information is partially or completely unknown. In those cases the unknown parentages is labeled with "Unknown". When available, synonyms for the strains were also collected. If a strain was named its PI number was also included as a synonym. In cases where the strain was found to be covered by PVP protection, the PVP registration number was also included. Because this list was based on participants in the Soybean Uniform Trials, not all named soybean strains are listed. For a complete list of named strains the user should consult GRIN.

To find the immediate parents of a line or cultivar tested in the Uniform Soybean Tests, type the cultivar name or strain identifier in the box below.

Find Line:

To limit the list below to either Northern or Southern strains, choose a region.

Uniform Test Data

Uniform Test Data

This is an experimental display of the data in the Northern Uniform Tests for the years 2012 and 2013. It is designed to closely approximate the main results labels in published reports for those years. The reader is encouraged to consult the reports for the Soybean Uniform Tests for the **Northern** and **Southern** Regions for the complete reports. To use this tool:

First Step

Choose the type of data you want to see (Strains and Parentage, Descriptive and Disease Data, Regional Summary, Yield, Yield Rank, Lodging, Plant Height, Seed Quality, Seed Size, Protein, Oil or Strain Description) by clicking on their text.

Second Step

Choose the maturity group and years to see by clicking on the radio buttons. The default is to see the parentage for maturity group 00 for all years.

Last Step

The last step is to click the text 'Set Maturity Group, Year, Strain'. The data will be sorted by strain and then by year for comparison. Not all strains were tested in both years so some strains will only have values in one year.

We are actively soliciting your suggestions for how to make this tool better. If you have suggestions, please contact us with your suggestions [here](#).

SoyBase GRIN Descriptor Data Tool

Data Explorer

← Back one step.

This page provides two tools for searching the germplasm phenotype data. One returns a list of germplasm accessions based on the phenotype data for the trait(s) previously selected. The other accepts a list of germplasm accessions and returns a table of phenotype data for the selected trait(s).

Identify Germplasm Based on Phenotype Data

Trait	Valid Range			
Linoleic	30.3–63.6	>=	30.3	and <= 63.6
Linolenic	2.7–18.7	>=	2.7	and <= 18.7
Oil	8.1–25.6	>=	8.1	and <= 25.6
Oleic	9.0–50.3	>=	9.0	and <= 50.3
Palmitic	4.1–20.4	>=	4.1	and <= 20.4
Stearic	1.1–10.6	>=	1.1	and <= 10.6

Prototype SoyBase SNP Haplotype Viewer

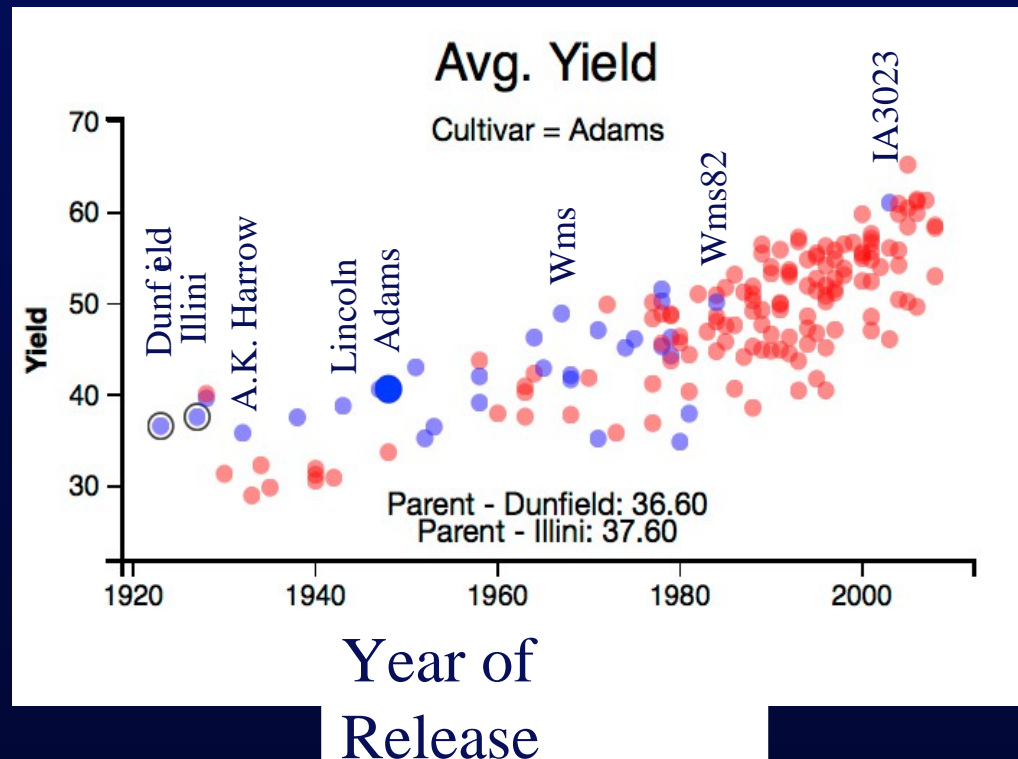

Prototype SoyBase SNP Haplotype Viewer

Soybean Milestones Sequencing Project

1. Increase soybean grower profits by improving the yield potential of soybean varieties.
2. Detect “breeder signatures” using DNA sequences of land races and varieties that represent “milestone” achievements in yield potential.
3. **Make the data publicly available for use by the soybean community.**

Soybean Milestones Sequencing Project

Tools have been integrated with SoyBase and will be formally announced next week.

Bulk data downloads will be made available in the coming weeks.

Data is being released pre-publication to the community.

Tools can be leveraged to handle other data types.

Root Apical Meristem

Descriptive Experiments

- [Expression data](#)

We used the GeneChip Soybean Genome Array (Affymetrix, Inc.) to study pollen and sporophytic tissue expression. Three biological replicates for pollen and two biological replicates for sporophytic tissues were used.

Gene Expression Projects

Title: Expression data from soybean seed compartments with embryos at the globular stage

GEO Dataset Accession: [GSE6414](#)

Web site: <http://seedgenenetwork.net>

Publication: [SoyBase20151003b](#)

Description:

Globular-stage seed compartments were isolated using the Leica AS LMD system. Total RNA was amplified and hybridized with Affymetrix Soybean Genome Arrays. Laser capture micro-dissection was used to isolate tissues at the globular embryo stage of seed development. Tissues were sampled using biological replication.

Samples:

- Embryo Proper
- Suspensor
- Seed Endosperm
- Seed Endothelium
- Seed Epidermis
- Seed Hilum
- Seed Inner Integument
- Seed Outer Integument Leaflet
- Whole Seed
